[Alberta Water Tool](#)

The Alberta Water Tool is a point-and-click tool that helps scientists, industry explorers, communities and government decision-makers to understand accurate, real-time information about water resources in Alberta. The Alberta Water Tool has been supported by AUPRF enabling it to be free for anyone to use and explore.

[AER Tools Application Software](#)

AERtools is a collection of spreadsheet and application programs created for air quality professionals for the calculation of source parameters and ground level concentrations. The tools were created based upon state-of-the-art engineering considerations of thermodynamics, energy balance, mass balance and practical application of these principles for use with current air dispersion models and methods.

[Condenser App](#)

A software Application which can accurately predict the benzene emissions reductions in condensing equipment. This Application can be widely applied in industry, incorporating sound engineering principles and underlying calculations including validation with accurate field measurements, utilizing a clear and comprehensive interface.
