

Alternative Emission Program Effectiveness Assessment

Fugitive Management (FEMP)

Cooper Robinson, Cap-Op Energy
18-ARPC-11

Alternative methane leak detection technologies and platforms such as trucks and planes promise cost-effective emissions mitigation compared to conventional OGI-based approaches. However, these new platforms can be successfully implemented only if the resultant emissions reductions are equivalent to those achieved by OGI-based ground LDAR teams. Therefore, it is critical to evaluate new technologies alongside OGI-based LDAR in a spatially and temporally consistent manner.
